

Things that need to be
improved with the App

Instead of this play button lets replace it with my logo for Birdie Social. My logo can be seen below and I will also give you the png file

Currently none of these buttons actually work and direct a user to login via those platforms.

Lets consolidate the options to be either instagram, apple or gmail. When you click on any of the buttons it should redirect you to that page to login.

Welcome to Birdie Social

Connect with local golfers, find your ideal playing partners, and book tee times together.

- ✓ Find golfers with similar skill levels and interests
- ✓ Book tee times and organize golf outings
- ✓ Share your golf achievements and connect with the community

Instead of this play button lets replace it with my logo for Birdie Social. My logo can be seen below and I will also give you the png file

This Full Name section does not work and does not allow the user to enter their full name

Similar situation as before - currently none of these buttons actually work and direct a user to login via those platforms.

Lets consolidate the options to be either facebook, apple or gmail. When you click on any of the buttons it should redirect you to that page to login.

Welcome to Birdie Social

Connect with local golfers, find your ideal playing partners, and book tee times together.

- ✓ Find golfers with similar skill levels and interests
- ✓ Book tee times and organize golf outings
- ✓ Share your golf achievements and connect with the community

Instead of this play button lets replace it with my logo for Birdie Social

I would like for users to be able to upload multiple photos/videos. Remember these pictures and videos will connect to the home screen where their profile card will appear.

I would like to add field where users can enter their occupation and should be free text

I would like to add a gender dropdown so users can selected “male”, “female”, or “other”

Add in a field for the user to enter their address. This is important for limiting potential matches to those that are near the physical location of the person. Ideally the user should be aske to automatically share their location and that should be stored with us but in case they decline we should also manually ask for their address or location to help with better matched

When any of these availability buttons are selected they turn a white color. Instead, I would like them to turn green when I click on it.

When I click this save and continue button I do not get advanced to main Home screen. Instead I have to refresh the page for it to load the home screen

I would like to add field where users can enter if they a member at a golf club. Can call it “Club Membership” and allow it to be free text

Instead of this play button lets replace it with my logo for Birdie Social

I would like a few dummy Birdie Social profile to be made here and have it functional. Just like tinder it should show some pictures/videos and then have a swipe up button/action which reveals more information about the user. Swiping is an important feature here. When users first open the app there should also be a little walkthrough showing them how to use the app. So basically, telling them a swipe left means no I am not open to a match” and a swipe right means yes I am open to a match”. Also showing them swipe up or click a button to reveal more information about that user.

Lets try and make the backend functional where in the demo a user has to swipe right on a dummy “Birdie Social” account and then that becomes a match and then as explained on the next slide there will be a dummy message from our Birdie Social dummy account that says something like...”Thanks for choosing to find your next golf buddy or Birdie Social. Keep swiping to find more matches!” something like that

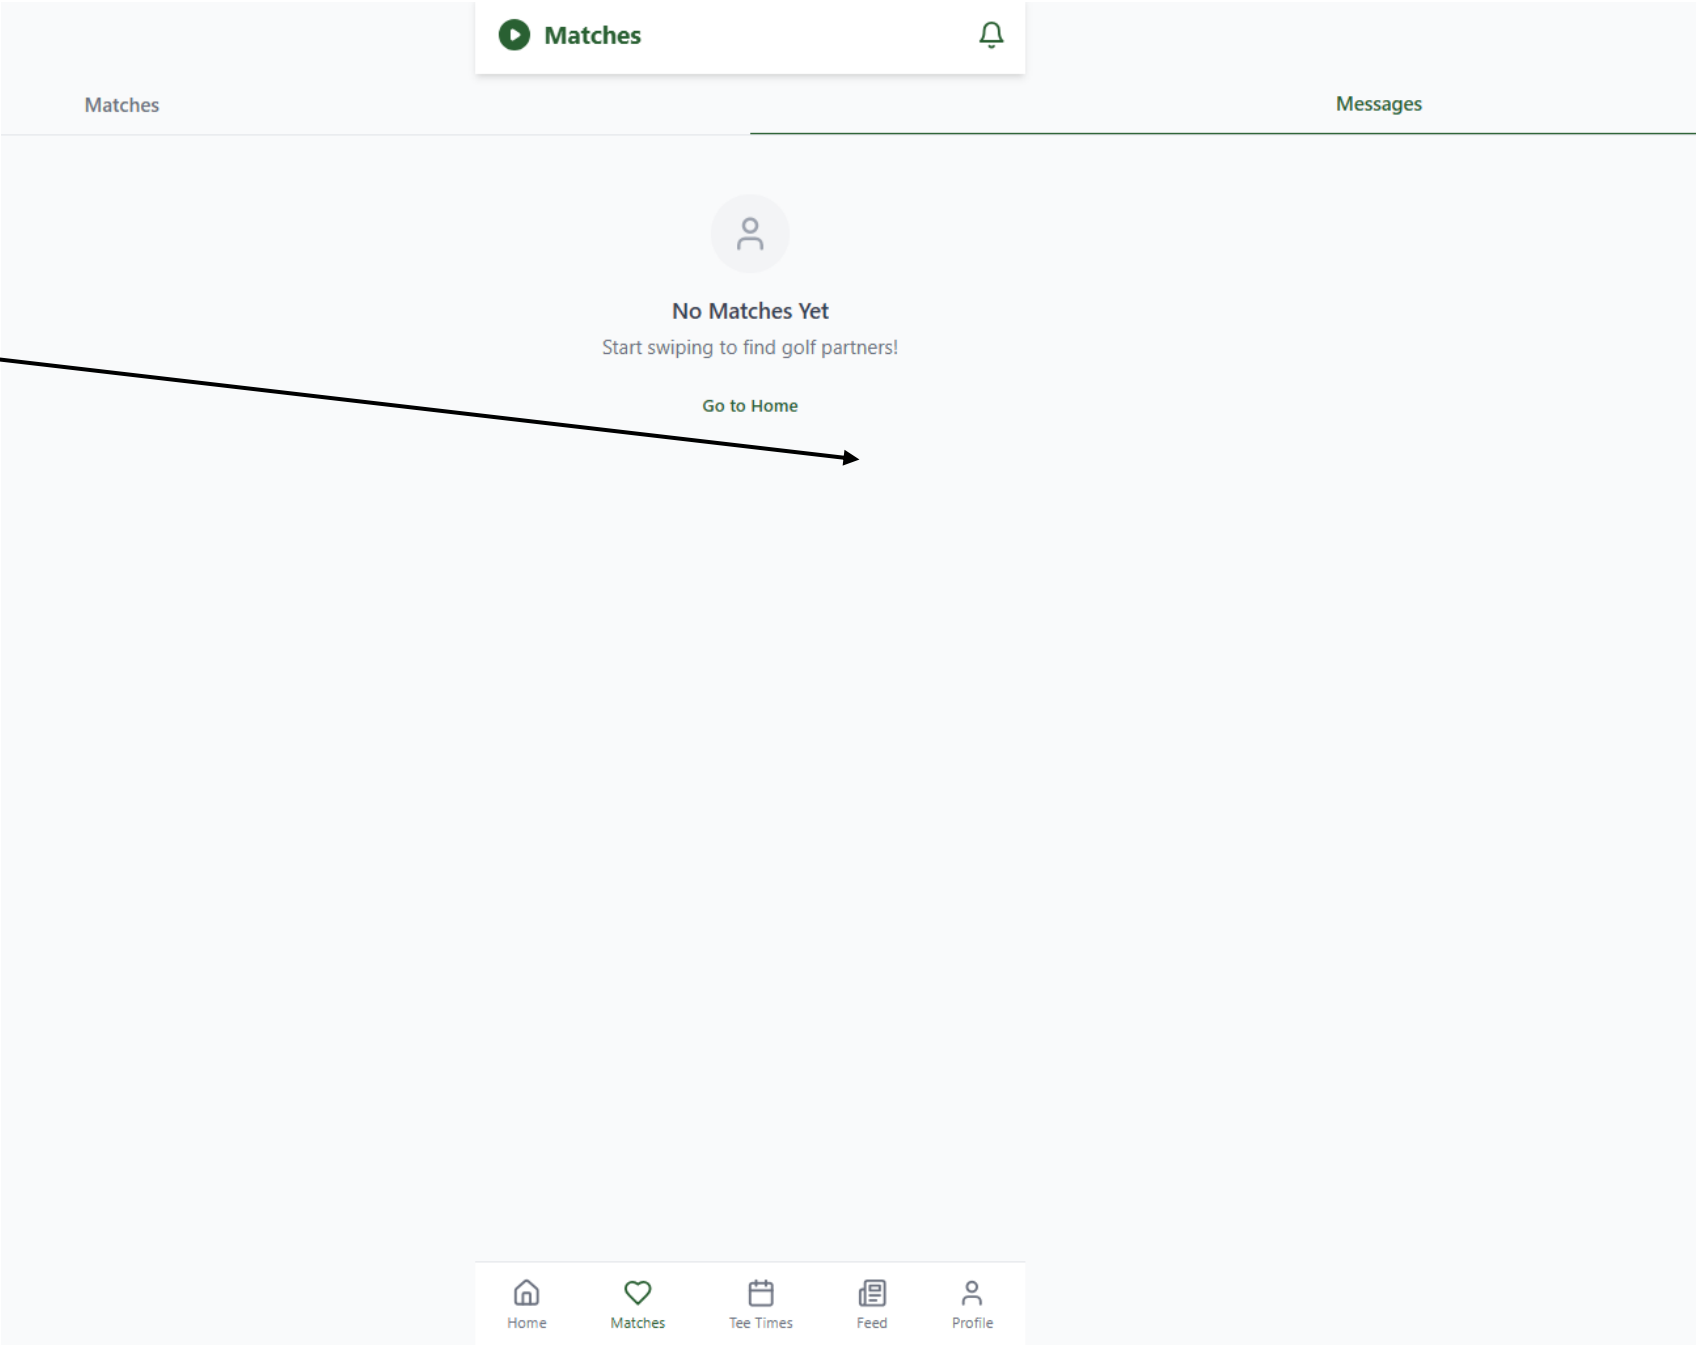

This adjust preferences button does not work. It should show options to filter by distance (so how far is this other person from you in increments of miles). It should have an option for gender, and it should also have some filtering for handicap

These filters should interact with the data and accordingly limit what type of profiles the user can see. We should probably add something that automatically grabs the user's location so we can effectively due some type of geo-based filtering – you can just have this as a popup in the beginning of the app and if users decline to automatically share their location then we can have them manually enter it and that can be used instead for the geo-based filtering

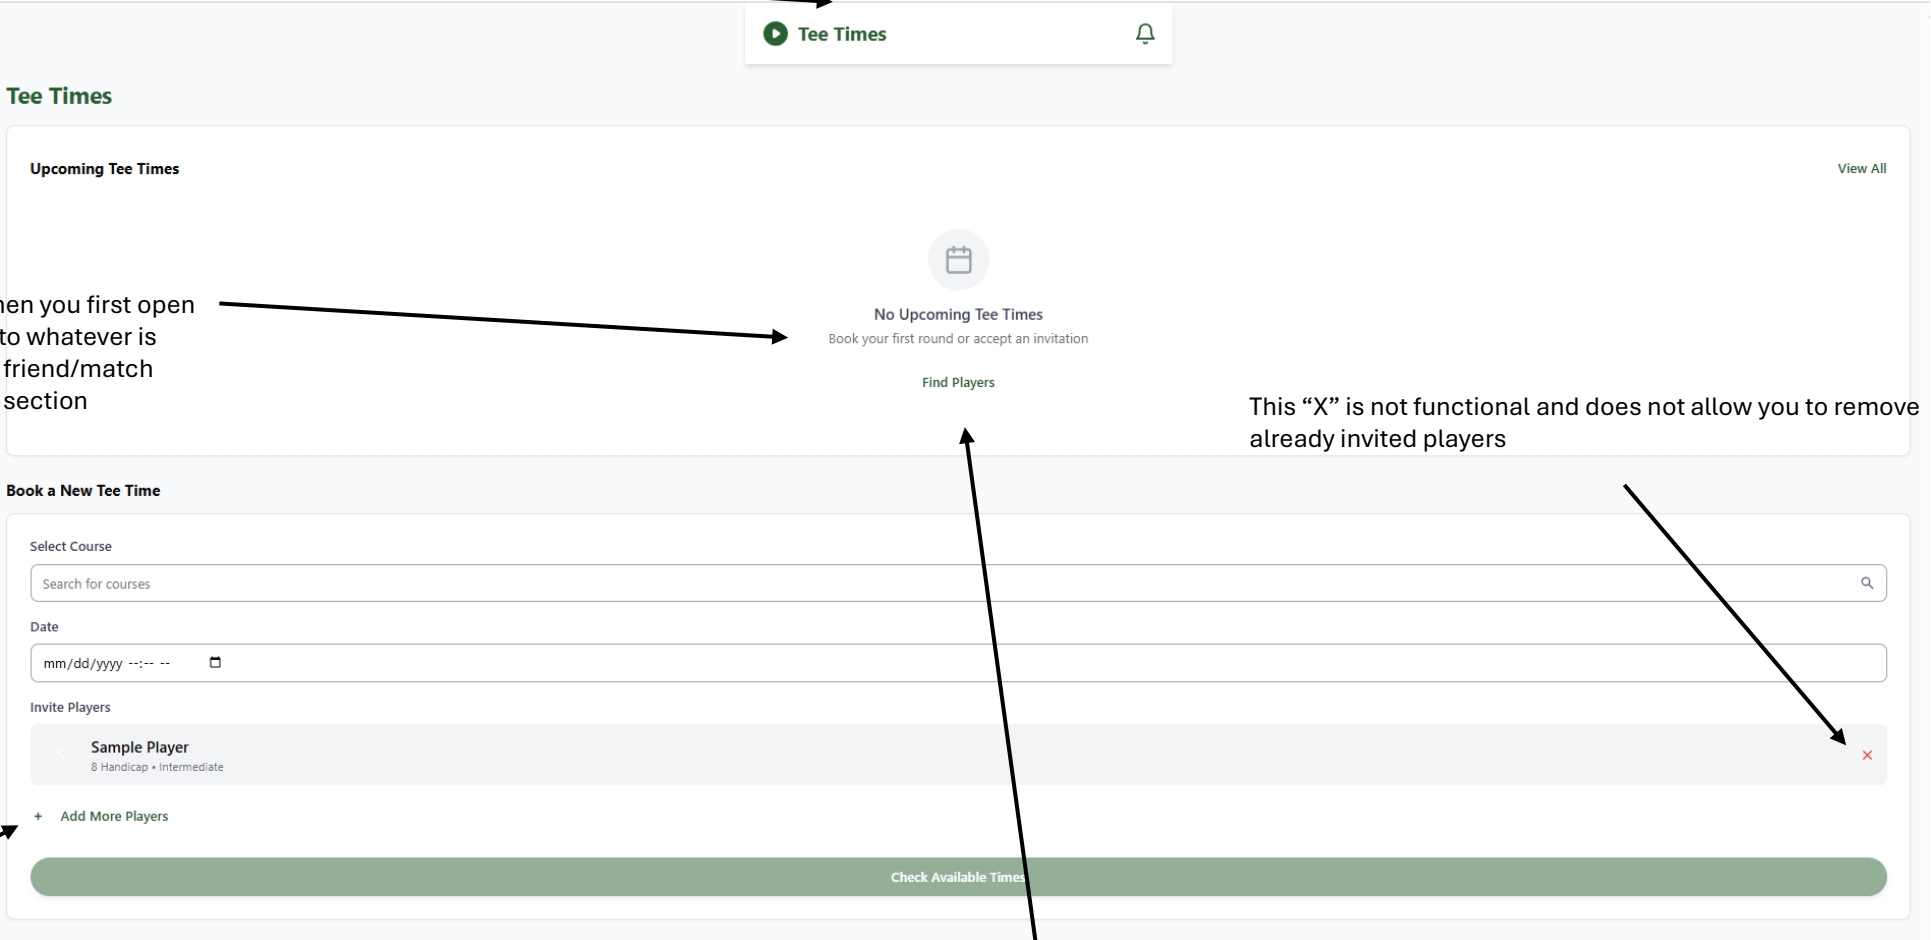

I think this page looks good too. The only thing I would add is that similar to the previous page – I would like some sort of instructional guide when the user first enters this page on how it functions.

To do this we can also include a dummy match with the “Birdie Social” brand and a dummy message welcoming them to the app

Similar comments as before regarding the play button and the notification bell

Lets just put a dummy tee time here for when you first open the app. Realistically this should connect to whatever is below so if you book a new tee time with a friend/match from the app, then it should appear in this section

This “X” is not functional and does not allow you to remove already invited players

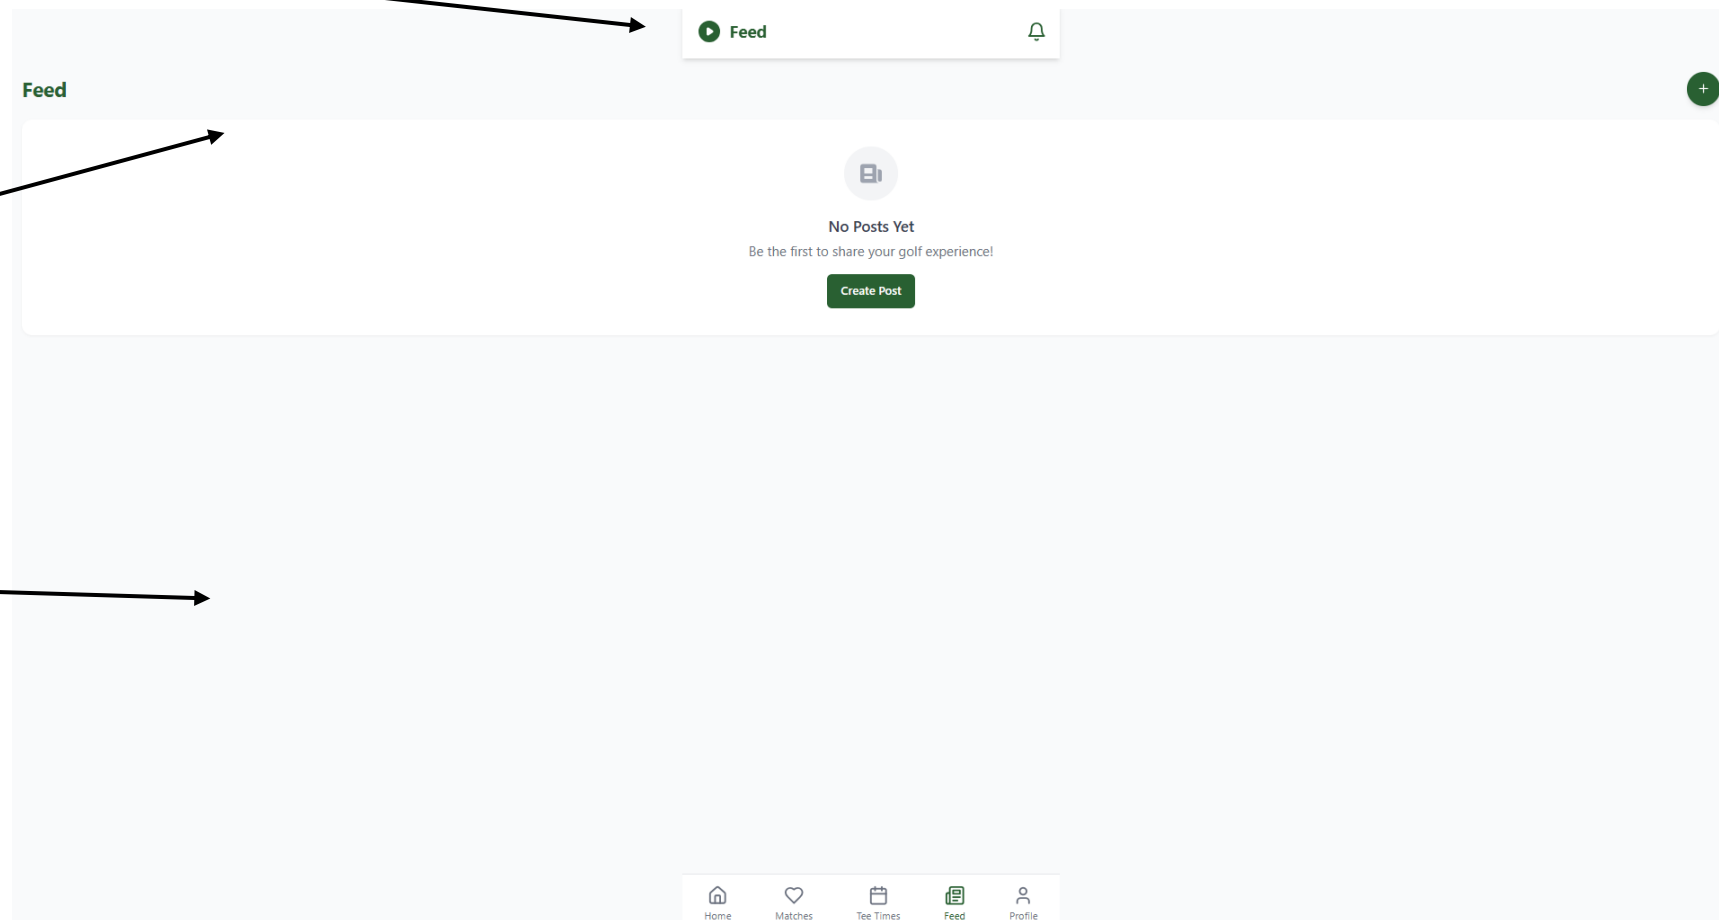

This button is not functional. If I click on it then it should give you a list from your matches and if you click on one of the names then it should filter the list to the tee times you have booked with that friend. For now lets have it so that if you click on it then it should show our dummy Birdie Social match as an option to invite for a new tee time

This Find Players button is not functional. If I click on it then it should give you a list from your matches and if you click on one of the names then it should filter the list to the tee times you have booked with that friend. For now lets have it so that if you click on it then it should show our dummy Birdie Social match as an option to select for and then subsequently filter the tee times scheduled to

Similar comments as before regarding the play button and the notification bell

Lets add a search bar here at the top where we can search for our matches in the app and then have the content filtered down specifically for that user

Remember so this should connect to whomever your matches are and be displayed here. Lets continuing with the comments from the last few slides, put a dummy Birdie Social Post here

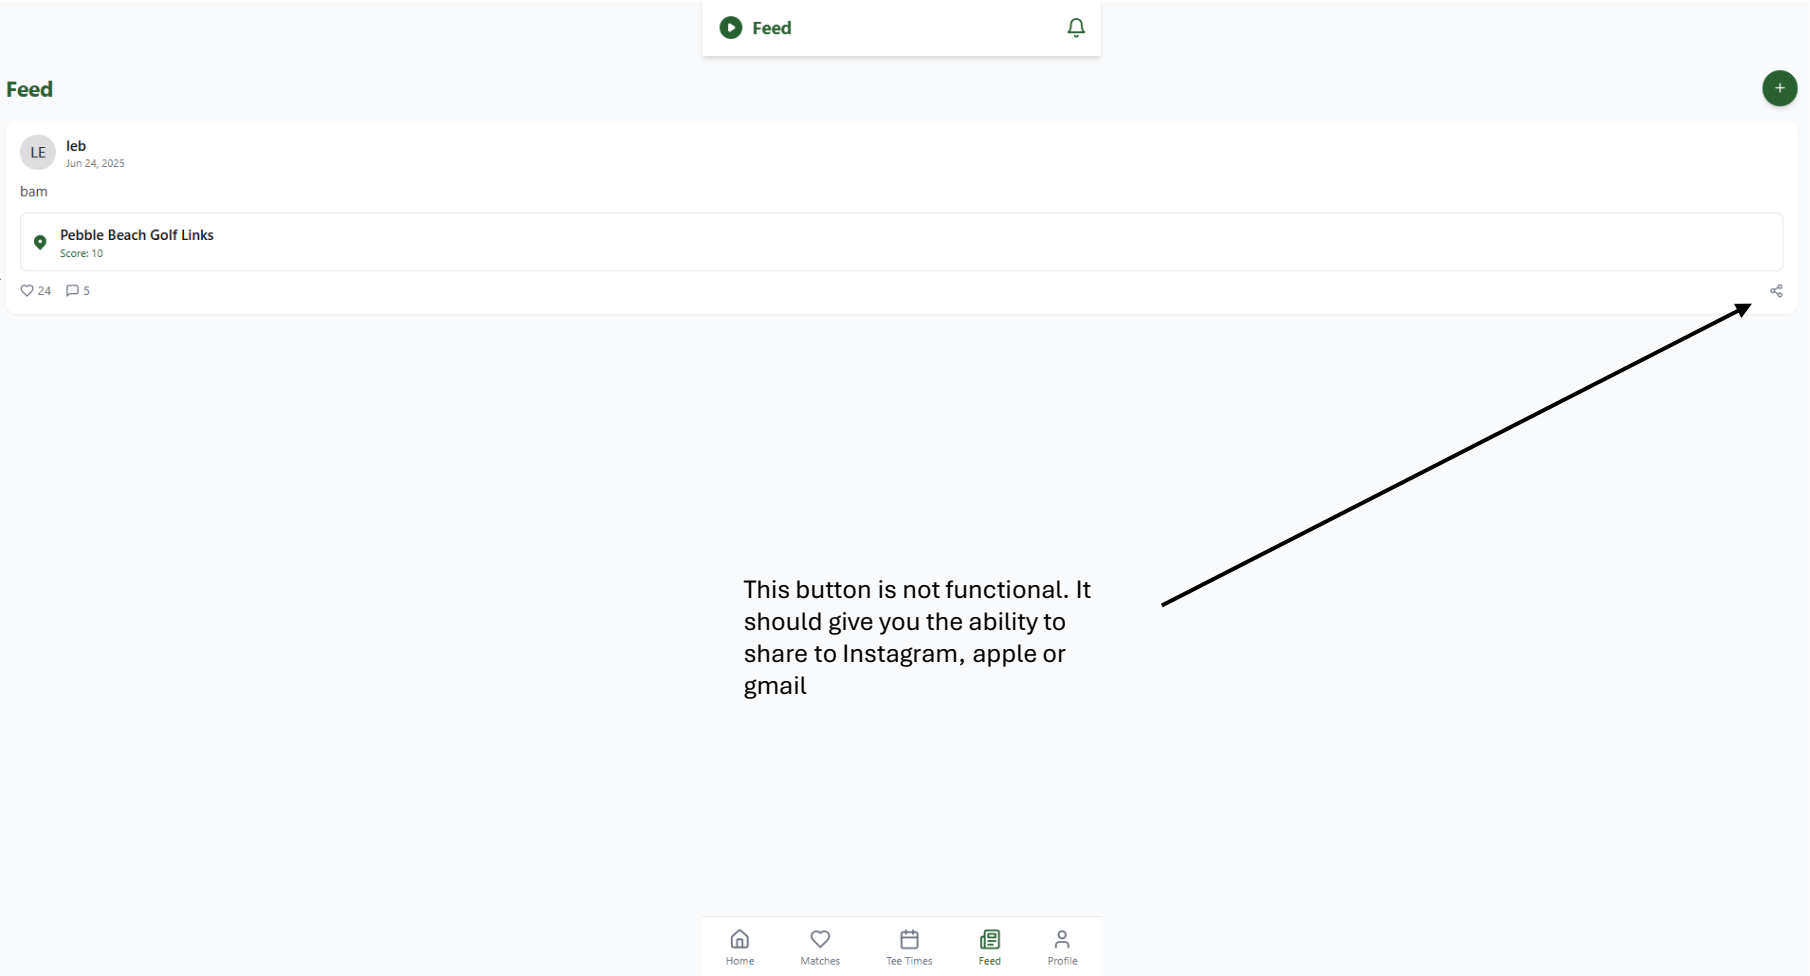

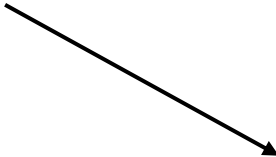

This add photos button is not functional

I want to add a field to tag some of your matches from the Birdie Social app. Keep the UI consistent for this addition

The image shows a mobile application interface with a dark theme. At the top, there's a navigation bar with a 'Feed' button and a bell icon. Below this, a 'Create Post' modal is open. The modal has a title 'Create Post' and a close button. It displays the user's profile 'LE leb' with the status 'Posting publicly'. There's a text input field with the placeholder 'What's on your mind?'. Below that is an 'Add Photos' button with a camera icon. Underneath is a section titled 'Add Golf Round Details' with three input fields: 'Course name' (with a green dot icon), 'Your score' (with a green calendar icon), and a date field 'mm/dd/yyyy' (with a green calendar icon). At the bottom of the modal is a green 'Post' button. Two arrows point from external text to the 'Add Photos' button and the date field.

Neither the like button or
comment button is functional

This button is not functional. It
should give you the ability to
share to Instagram, apple or
gmail

Make these Golf Stats
autopopulate based on data
from the feed tab

When I click on the edit profile, I
should have a back button that
allows me to come back to this
page

Both of these fields should
autopopulate based on actions
from other parts of the app.
Mainly the Tee Times section

Should autopopulate base don
the tee times you have entered
